# 1 Introduction

This is a manual describing the Sail specification language, its common library, compiler, interpreter and type system. However it is currently in early stages of being written, so questions to the developers are highly encouraged.

## 2 Tips for Writing Sail specifications

This section attempts to offer advice for writing Sail specifications that will work well with the Sail executable interpreter and compilers.

These tips use idiomatic Sail code; the Sail syntax is formally defined in following section.

Some tips might also be advice for good ways to specify instructions; this will come from a combination of users and Sail developers.

- Declare memory access functions as one read, one write for each kind of access.

For basic user-mode instructions, there should be the need for only one memory read and one memory write function. These should each be declared using `val extern` and should have effect `wmem` and `rmem` accordingly.

Commonly, a memory read function will take as parameters a size (an number below 32) and an address and return a bit vector with length  $(8 * \text{size})$ . The sequential and concurrent interpreters both only read and write memory as a factor of bytes.

- Declare a default vector order

Vectors can be either decreasing or increasing, i.e. if we have a vector  $a$  with elements  $[1,2,3]$  then in an increasing specification the 1 is accessed with `a[0]` but with `a[2]` in a decreasing system. Early in your specification, it is beneficial to clarity to say `default Ord inc` or `default Ord dec`.

- Vectors don't necessarily begin indexing at 0 or n-1

Without any additional specification, a vector will begin indexing at 0 in an increasing spec and n-1 in a decreasing specification. A type declaration can reset this first position to any number.

Importantly, taking a slice of a vector does not reset the indexes. So if `a = [1,2,3,4]` in an increasing system the slice `a[2 .. 3]` generates the vector `[3,4]` and the 3 is indexed at 2 in either vector.

- Be precise in numeric types.

While Sail includes very wide types like `int` and `nat`, consider that for bounds checking, numeric operations, and and clear understanding, these really are unbounded quantities. If you know that a number in the specification will range only between 0 and 32, 0 and 4,  $-32$  to  $32$ , it is better to use a specific range type such as `[[32]]`.

Similarly, if you don't know the range precisely, it may also be best to remain polymorphic and let Sail's type resolution work out bounds in a particular use rather than removing all bounds; to do this, use `[:'n:]` to say that it will polymorphically take some number.

- Use bit vectors for registers.

Sail the language will readily allow a register to store a value of any type. However, the Sail executable interpreter expects that it is simulating a uni-processor machine where all registers are bit vectors.

A vector of length one, such as  $a$  can read the element of  $a$  either with **a** or **a[0]**.

- Have functions named `decode` and `execute` to evaluate instructions.

The sail interpreter is hard-wired to look for functions with these names.

### 3 Sail syntax

$l$	::=	Source location
$annot$	::=	
$id$	::=	Identifier
		$x$
		( <b>deinfix</b> $x$ )      remove infix status
		<b>bool</b> M      Built in type identifiers
		<b>bit</b> M
		<b>unit</b> M
		<b>nat</b> M
		<b>string</b> M
		<b>range</b> M
		<b>atom</b> M
		<b>vector</b> M
		<b>list</b> M
		<b>set</b> M
		<b>reg</b> M

		<i>to_num</i>	M	Built in function identifiers
		<i>to_vec</i>	M	
<i>kid</i>	::=			variables with kind, ticked to differntiate from program variables
		' <i>x</i>		
<i>base_kind</i>	::=			base kind
		<b>Type</b>		kind of types
		<b>Nat</b>		kind of natural number size expressions
		<b>Order</b>		kind of vector order specifications
		<b>Effect</b>		kind of effect sets
<i>kind</i>	::=			kinds
		<i>base_kind</i> <sub>1</sub> → ... → <i>base_kind</i> <sub><i>n</i></sub>		
<i>nexp</i>	::=			expression of kind Nat, for vector sizes and origins
		<i>id</i>		identifier, bound by def Nat x = nexp
		<i>kid</i>		variable
		<i>num</i>		constant
		<i>nexp</i> <sub>1</sub> * <i>nexp</i> <sub>2</sub>		product
		<i>nexp</i> <sub>1</sub> + <i>nexp</i> <sub>2</sub>		sum
		<i>nexp</i> <sub>1</sub> − <i>nexp</i> <sub>2</sub>		subtraction
		2 * * <i>nexp</i>		exponential
		<b>neg</b> <i>nexp</i>		For internal use
		( <i>nexp</i> )	S	
<i>order</i>	::=			vector order specifications, of kind Order
		<i>kid</i>		variable
		<b>inc</b>		increasing (little-endian)
		<b>dec</b>		decreasing (big-endian)

		( <i>order</i> )	S	
<i>base_effect</i>	::=			effect
		<b>rreg</b>		read register
		<b>wreg</b>		write register
		<b>rmem</b>		read memory
		<b>wmem</b>		write memory
		<b>wmea</b>		signal effective address for writing memory
		<b>wmv</b>		write memory, sending only value
		<b>barr</b>		memory barrier
		<b>depend</b>		dynamic footprint
		<b>undef</b>		undefined-instruction exception
		<b>unspec</b>		unspecified values
		<b>nondet</b>		nondeterminism from intra-instruction parallelism
		<b>escape</b>		Tracking of expressions and functions that might call exit
		<b>lset</b>		Local mutation happend; not user-writable
<i>effect</i>	::=			effect set, of kind Effects
		<i>kid</i>		
		$\{base\_effect_1, .., base\_effect_n\}$		effect set
		<b>pure</b>	M	sugar for empty effect set
		$effect_1 \uplus .. \uplus effect_n$	M	meta operation for combining sets of effects
<i>typ</i>	::=			Type expressions, of kind <b>Type</b>
		-		Unspecified type
		<i>id</i>		Defined type
		<i>kid</i>		Type variable
		$typ_1 \rightarrow typ_2$ <b>effect</b> <i>effect</i>		Function type (first-order only in user code)
		$(typ_1, ..., typ_n)$		Tuple type
		$id\langle typ\_arg_1, .., typ\_arg_n \rangle$		type constructor application

		( <i>typ</i> )	S	
		[ <i>nexp</i> ]	S	sugar for <code>range&lt;0, nexp&gt;</code>
		[ <i>nexp</i> : <i>nexp'</i> ]	S	sugar for <code>range&lt; nexp, nexp'&gt;</code>
		[ : <i>nexp</i> : ]	S	sugar for <code>atom&lt;nexp&gt;</code> which is special case of <code>range&lt;nexp,nexp&gt;</code>
		<i>typ</i> [ <i>nexp</i> ]	S	sugar for vector indexed by [ <i>nexp</i> ]
		<i>typ</i> [ <i>nexp</i> : <i>nexp'</i> ]	S	sugar for vector indexed by [ <i>nexp</i> .. <i>nexp'</i> ]
		<i>typ</i> [ <i>nexp</i> <: <i>nexp'</i> ]	S	sugar for increasing vector indexed as above
		<i>typ</i> [ <i>nexp</i> >: <i>nexp'</i> ]	S	sugar for decreasing vector indexed as above
<i>typ_arg</i>	::=			Type constructor arguments of all kinds
		<i>nexp</i>		
		<i>typ</i>		
		<i>order</i>		
		<i>effect</i>		
<i>n_constraint</i>	::=			constraint over kind <b>Nat</b>

		$id(pat_1, \dots, pat_n)$	union constructor pattern
		$\{fpat_1; \dots; fpat_n; ^?\}$	struct pattern
		$[pat_1, \dots, pat_n]$	vector pattern
		$[num_1 = pat_1, \dots, num_n = pat_n]$	vector pattern (with explicit indices)
		$pat_1 : \dots : pat_n$	concatenated vector pattern
		$(pat_1, \dots, pat_n)$	tuple pattern

	$[[pat_1, \dots, pat_n]]$		list pattern
	$(pat)$	S	
$fpat$	$::=$		Field pattern
	$id = pat$		
$exp$	$::=$		Expression
	$\{exp_1; \dots; exp_n\}$		block
	<b>nondet</b> $\{exp_1; \dots; exp_n\}$		nondeterministic block, expressions evaluate in an unspecified order, or concurrently
	$id$		identifier
	$lit$		literal constant
	$(typ)exp$		cast
	$id(exp_1, \dots, exp_n)$		function application
	$id\ exp$	S	No extra parens needed when exp is a tuple
	$exp_1\ id\ exp_2$		infix function application
	$(exp_1, \dots, exp_n)$		tuple
	<b>if</b> $exp_1$ <b>then</b> $exp_2$ <b>else</b> $exp_3$		conditional
	<b>if</b> $exp_1$ <b>then</b> $exp_2$	S	
	<b>foreach</b> $(id\ from\ exp_1\ to\ exp_2\ by\ exp_3\ in\ order)exp_4$		loop
	<b>foreach</b> $(id\ from\ exp_1\ to\ exp_2\ by\ exp_3)exp_4$	S	
	<b>foreach</b> $(id\ from\ exp_1\ to\ exp_2)exp_3$	S	
	<b>foreach</b> $(id\ from\ exp_1\ downto\ exp_2\ by\ exp_3)exp_4$	S	
	<b>foreach</b> $(id\ from\ exp_1\ downto\ exp_2)exp_3$	S	
	$[exp_1, \dots, exp_n]$		vector (indexed from 0)
	$[num_1 = exp_1, \dots, num_n = exp_n\ opt\_default]$		vector (indexed consecutively)
	$exp[exp']$		vector access
	$exp[exp_1..exp_2]$		subvector extraction
	$[exp\ with\ exp_1 = exp_2]$		vector functional update
	$[exp\ with\ exp_1 : exp_2 = exp_3]$		vector subrange update (with vector)
	$exp : exp_2$		vector concatenation

	$[[[exp_1, \dots, exp_n]]]$	list
	$exp_1 :: exp_2$	cons
	$\{fexprs\}$	struct
	$\{exp \textbf{ with } fexprs\}$	functional update of struct
	$exp.id$	field projection from struct
	$\textbf{switch } exp \{ \textbf{case } pexp_1 \dots \textbf{case } pexp_n \}$	pattern matching
	$\textbf{letbind in } exp$	let expression
	$lexp := exp$	imperative assignment
	$\textbf{exit } exp$	expression to halt all current execution, potentially calling a system, trap, or interrupt handler with exp
	$\textbf{assert } (exp, exp')$	expression to halt with error, when the first expression is true, reporting the optional string as an error
	$(exp)$	S
	$(annot)exp$	This is an internal cast, generated during type checking that will resolve into a syntactic cast after
	$annot$	This is an internal use for passing nexp information to library functions, postponed for constraint solving
	$annot, annot'$	This is like the above but the user has specified an implicit parameter for the current function
	$\textbf{comment } string$	For generated unstructured comments
	$\textbf{comment } exp$	For generated structured comments
	$\textbf{let } lexp = exp \textbf{ in } exp'$	This is an internal node for compilation that demonstrates the scope of a local mutable variable
	$\textbf{let } pat = exp \textbf{ in } exp'$	This is an internal node, used to distinguished some introduced lets during processing from original ones
	$\textbf{return } (exp)$	For internal use to embed into monad definition
$lexp$	$::=$	lvalue expression
	$id$	identifier
	$id(exp_1, \dots, exp_n)$	memory write via function call
	$id \ exp$	S

## 5 Sail type system

### 5.1 Internal type syntax

$k$	$::=$	Internal kinds
	$K\_Typ$	
	$K\_Nat$	
	$K\_Ord$	
	$K\_Efct$	
	$K\_Lam(k_0 \dots k_n \rightarrow k')$	
	$K\_infer$	Representing an unknown kind, inferred by context
$t, u$	$::=$	Internal types
	$x$	
	$'x$	
	$t_1 \rightarrow t_2 \text{ effect}$	
	$(t_1, \dots, t_n)$	
	$x\langle t\_args \rangle$	
	$t \mapsto t_1$	
	<b>register</b> $\langle t\_arg \rangle$	S
	<b>range</b> $\langle ne \ ne' \rangle$	S
	<b>atom</b> $\langle ne \rangle$	S
	<b>vector</b> $\langle ne \ ne' \ order \ t \rangle$	S
	<b>list</b> $\langle t \rangle$	S
	<b>reg</b> $\langle t \rangle$	S
	<b>implicit</b> $\langle ne \rangle$	S
	<b>bit</b>	S
	<i>string</i>	S
	<b>unit</b>	S
	$t[t\_arg_1/tid_1 \dots t\_arg_n/tid_n]$	M

<i>optx</i>	::=	
		<i>x</i>
<i>tag</i>	::=	Data indicating where the identifier arises and thus information necessary in compilation
		<b>None</b>
		<b>Intro</b> Denotes an assignment and lexp that introduces a binding
		<b>Set</b> Denotes an expression that mutates a local variable
		<b>Global</b> Globally let-bound or enumeration based value/variable
		<b>Ctor</b> Data constructor from a type union
		<b>Extern</b> <i>optx</i> External function, specied only with a val statement
		<b>Default</b> Type has come from default declaration, identifier may not be bound locally
		<b>Spec</b>
		<b>Enum</b> <i>num</i>
		<b>Alias</b>
		<i>Unknown_pathoptx</i> Tag to distinguish an unknown path from a non-analysis non deterministic path
<i>ne</i>	::=	internal numeric expressions
		' <i>x</i>
		<i>num</i>
		<b>infinity</b>
		<i>ne</i> <sub>1</sub> * <i>ne</i> <sub>2</sub>
		<i>ne</i> <sub>1</sub> + ... + <i>ne</i> <sub><i>n</i></sub>
		<i>ne</i> <sub>1</sub> − <i>ne</i> <sub>2</sub>
		2** <i>ne</i>
		(− <i>ne</i> )
		<b>zero</b> S
		<b>one</b> S
		<b>bitlength</b> ( <i>bin</i> ) M
		<b>bitlength</b> ( <i>hex</i> ) M

		<b>count</b> ( $num_0 \dots num_i$ )	M	
		<b>length</b> ( $pat_1 \dots pat_n$ )	M	
		<b>length</b> ( $exp_1 \dots exp_n$ )	M	
$t\_arg$	::=			Argument to type constructors
		$t$		
		$ne$		
		$effect$		
		$order$		
		<b>fresh</b>	M	
$t\_args$	::=			Arguments to type constructors
		$t\_arg_1 \dots t\_arg_n$		
$nec$	::=			Numeric expression constraints
		$ne \leq ne'$		
		$ne = ne'$		
		$ne \geq ne'$		
		$\exists x \text{ IN } \{num_1, \dots, num_n\}$		
		$nec_0 \dots nec_n \rightarrow nec'_0 \dots nec'_m$		
		$nec_0 \dots nec_n$		
$\Sigma^N$	::=			nexp constraint lists
		$\{nec_1, \dots, nec_n\}$		
		$\Sigma^N_1 \uplus \dots \uplus \Sigma^N_n$	M	
		<b>consistent_increase</b> $ne_1 ne'_1 \dots ne_n ne'_n$	M	Generates constraints from pairs of constraints, where the first of each pair is always larger than the second
		<b>consistent_decrease</b> $ne_1 ne'_1 \dots ne_n ne'_n$	M	Generates constraints from pairs of constraints, where the first of each pair is always smaller than the second
		<b>resolve</b> ( $\Sigma^N$ )		
$E^D$	::=			Environments storing top level information, such as defined abbreviations, records, enumerations, and kinds

	$ \begin{array}{ l} \langle E^K, E^A, E^R, E^E \rangle \\ \epsilon \\ E^D \uplus E^{D'} \end{array} $	
$kinf$	$ \begin{array}{ l} ::= \\ k \\ k \textbf{ default} \end{array} $	Whether a kind is default or from a local binding
$tid$	$ \begin{array}{ l} ::= \\ id \\ kid \end{array} $	A type identifier or type variable
$E^K$	$ \begin{array}{ l} ::= \\ \{tid_1 \mapsto kinf_1, \dots, tid_n \mapsto kinf_n\} \\ E^K_1 \uplus \dots \uplus E^K_n \\ E^K \setminus E^K_1 \dots E^K_n \end{array} $	Kind environments
		$ \begin{array}{ l} \text{M} \quad \text{In a unioning kinf, k default u k results in k (i.e. the default is locally forgotten)} \\ \text{M} \end{array} $
$tinf$	$ \begin{array}{ l} ::= \\ t \\ E^K, \Sigma^N, tag, t \end{array} $	Type variables, type, and constraints, bound to an identifier
$E^A$	$ \begin{array}{ l} ::= \\ \{tid_1 \mapsto tinf_1, \dots, tid_n \mapsto tinf_n\} \\ E^A_1 \uplus \dots \uplus E^A_n \end{array} $	
$field\_typs$	$ \begin{array}{ l} ::= \\ id_1 : t_1, \dots, id_n : t_n \end{array} $	Record fields
$E^R$	$ \begin{array}{ l} ::= \\ \{\{field\_typs_1\} \mapsto tinf_1, \dots, \{field\_typs_n\} \mapsto tinf_n\} \end{array} $	Record environments

		$E_1^R \uplus \dots \uplus E_n^R$	M
$enumerate\_map$	$::=$	$\{num_1 \mapsto id_1 \dots num_n \mapsto id_n\}$	
$E^E$	$::=$	$\{t_1 \mapsto enumerate\_map_1, \dots, t_n \mapsto enumerate\_map_n\}$   $E_1^E \uplus \dots \uplus E_n^E$	Enumeration environments
$E^T$	$::=$	$\{id_1 \mapsto tinf_1, \dots, id_n \mapsto tinf_n\}$   $\{id \mapsto \mathbf{overload} \ tinf \ conformsto : tinf_1, \dots, tinf_n\}$   $(E_1^T \uplus \dots \uplus E_n^T)$   $\uplus E_1^T \dots E_n^T$   $E^T \setminus id_1 \dots id_n$   $(E_1^T \cap \dots \cap E_n^T)$   $\cap E_1^T \dots E_n^T$	Type environments M M M M M
$ts$	$::=$	$t_1, \dots, t_n$	
$E$	$::=$	$\langle E^T, E^D \rangle$   $\epsilon$   $E \uplus E'$	Definition environment and lexical environment M
$I$	$::=$	$\langle \Sigma^N, effect \rangle$   $I_\epsilon$   $I_1 \uplus I_2$	Information given by type checking an expression Empty constraints, effect

	$I_1 \uplus \dots \uplus I_n$	Unions the constraints and effect
<i>formula</i>	$::=$	
	<i>judgement</i>	
	$formula_1 \dots formula_n$	
	$E^K(tid) \triangleright kinf$	Kind lookup
	$E^A(tid) \triangleright tinf$	
	$E^T(id) \triangleright tinf$	Type lookup
	$E^T(id) \triangleright \mathbf{overload} \ tinf : tinf_1 \dots tinf_n$	Overloaded type lookup
	$E^K(tid) < - k$	Update the kind associated with id to k
	$E^R(id_0 \dots id_n) \triangleright t, ts$	Record lookup
	$E^R(t) \triangleright id_0 : t_0 \dots id_n : t_n$	Record loopup by type
	$E^E(t) \triangleright enumerate\_map$	Enumeration lookup by type
	$\mathbf{dom}(E^T_1) \cap \mathbf{dom}(E^T_2) = \emptyset$	
	$\mathbf{dom}(E^K_1) \cap \mathbf{dom}(E^K_2) = \emptyset$	
	$\mathbf{disjoint} \ \mathbf{doms}(E^T_1, \dots, E^T_n)$	Pairwise disjoint domains
	$id \notin \mathbf{dom}(E^K)$	
	$id \notin \mathbf{dom}(E^T)$	
	$id_0 : t_0 \dots id_n : t_n \subset id'_0 : t'_0 \dots id'_i : t'_i$	
	$num_1 < \dots < num_n$	
	$num_1 > \dots > num_n$	
	$exp_1 \equiv exp_2$	
	$E^K_1 \equiv E^K_2$	
	$E^K_1 \approx E^K_2$	
	$E^T_1 \equiv E^T_2$	
	$E^R_1 \equiv E^R_2$	
	$E^E_1 \equiv E^E_2$	
	$E^D_1 \equiv E^D_2$	
	$E_1 \equiv E_2$	
	$\Sigma^N_1 \equiv \Sigma^N_2$	

	$id \equiv' id$
	$x_1 \neq x_2$
	$lit_1 \neq lit_2$
	$I_1 \equiv I_2$
	$effect_1 \equiv effect_2$
	$t_1 \equiv t_2$
	$ne \equiv ne'$
	$kid \equiv fresh\_kid(E^D)$

## 5.2 Type relations

$\boxed{E^K \vdash_t t \mathbf{ok}}$  Well-formed types

$$\begin{array}{c}
\frac{E^K('x) \triangleright K\_Typ}{E^K \vdash_t 'x \mathbf{ok}} \text{ CHECK\_T\_VAR} \\
\\
\frac{E^K('x) \triangleright K\_infer \quad E^K('x) < -|K\_Typ}{E^K \vdash_t 'x \mathbf{ok}} \text{ CHECK\_T\_VARINFER} \\
\\
\frac{E^K \vdash_t t_1 \mathbf{ok} \quad E^K \vdash_t t_2 \mathbf{ok} \quad E^K \vdash_e effect \mathbf{ok}}{E^K \vdash_t t_1 \rightarrow t_2 effect \mathbf{ok}} \text{ CHECK\_T\_FN} \\
